

Activity:

The aim of this activity is for children to practise finding pairs of values. There are three questions to complete. The first two questions allow children to practise the skill, while the third question extends them as they have to problem solve and explain their answer.

Vocabulary:

Expressions are numbers, symbols and operators (+, −, x, ÷) that are grouped together to show the value of something. $2y + 6$ is an example of an expression. The expression can take different values depending on the value of y .

An **equation** like $y + 3 = 16$ for example, is different to an expression because y has a specific value to produce the answer 16.

Find Pairs of Values 2

1.

2. Various answers, for example: $a = 3, b = 5$; $a = 6, b = 10$; $a = 9, b = 15$; $a = 12, b = 20$; $a = 15, b = 25$

3. The pairs $a = 9$ and $b = 4$, and $a = 6$ and $b = 5$ are incorrect. This is because b needs to be greater than a for the statement to work.
